

Bridge principle

idea - "connecting components through abstractions"

Bridge decouples abstractions from its
& implementations.

What problem does it solve.

Imagine we have a Car class

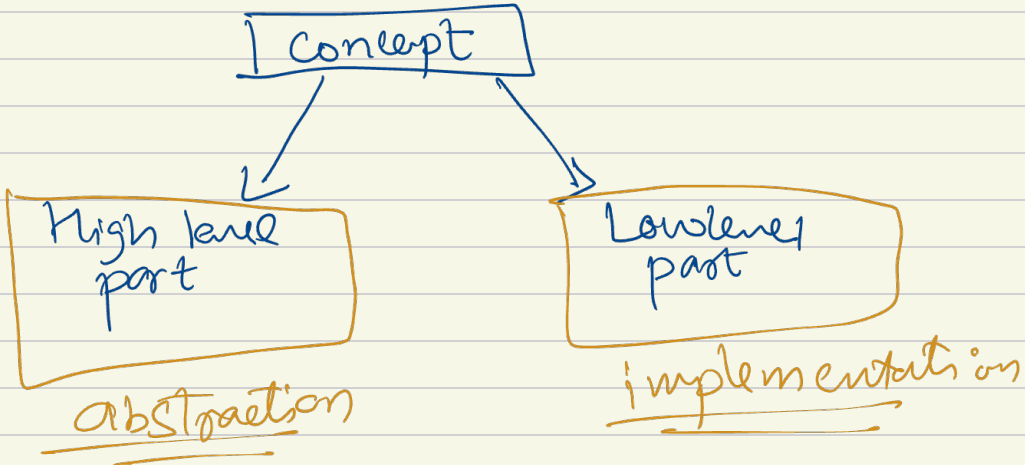

many combinations can exist.

$m \times n$ types of cars can exist.

Someone to maintain " $m \times n$ " classes.

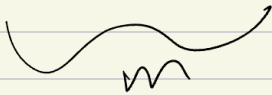

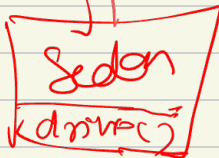

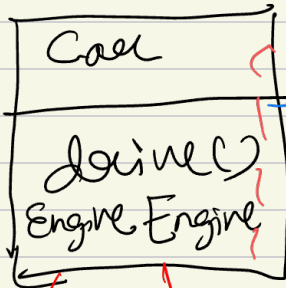

Class Explosion

Bridge pattern

car types

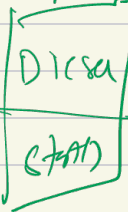

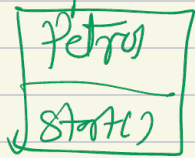

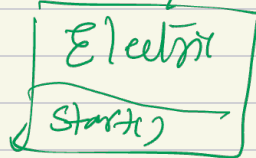

HLP <abstract>

with class

Car engine

LLP <abstract>

bridge is formed

'has a'
